                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 25; Page 50; 88pp; English.

The present sequence represents a cancer peptide that corresponds to amino acid residues 49-62 of human BSO-1/CAG-3 (or CAG-3) ORF1 (see AAV05965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAV05966), portions of them and their variants (see AAV05967-8F), are useful as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antisense oligonucleotides that inhibit expression of

Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAV05966), portions of them and their variants (see AAV05967-87), are useful as cancer vaccines that protect against cancer. The invention provides vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide, useful in diagnostic and detection assays, and methods for preventing or inhibiting cancer by administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are
the cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide, useful in diagnostic and detection assays, and methods for preventing or inhibiting cancer by administering a cancer peptide, with or without an HiA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by inducing cancer-specific T cells in vitro for subsequent
                                                                                                                                                                                                                                                                                                           Gaps

```
The present sequence represents a cancer peptide that is based on amino acid residues 44-62 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAY05965), and and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAY05966), portions of them and their variants (see AAY05967-CC 3 ORF2 (see AAY05966), portions of them and their variants (see AAY05967-CC 97), are useful as cancer vaccines that protect against cancer. The invention provides; vectors and host cells (also useful as vaccines); a contisense oligonucleotides that inhibit expression of the cancer peptide. The cancer by administering a cancer peptide, with a mileoule. The cancer peptides that inhibiting cancer by administering a cancer peptide, with or without an inhibiting cancer petides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast,
                                                                                                                                                                                                                    ö
                  lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, ecritcal cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by inducing cancer-specific T cells in vitro for subsequent
derived from, cancers such as primary or metastatic melanoma, thymoma

several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the parent polypeptide to imped, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polypeptide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptide and polymucleotides are referred to as a Savine. The synthetic polypeptide is useful for are referred to as a Savine. The synthetic polypeptide is useful for are referred to as a Savine. The synthetic polypeptide is useful for are referred to as a Savine. The synthetic polypeptide is useful for a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, conceptagus, brain, testicle, uterus), as potentiating agents.

Compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HV (human cumunosficiency virus), hepatitis, influenza, Japanese encephalitis virus, betetin-Barr virus and respiratory synctytal virus), bacterial (e.g., infections caused by Neasseria, Meningococcal, Haemophilus, Streptococcal, Legionella and Mycobacterium or parasitic

This invention relates to a novel method of identifying a polypeptide suitable for epitope liberation, including the steps of identifying an epitope of interest; providing substrate polypeptide sequence including the epitope, wherein the substrate permits processing by a proteasome; contacting the substrate with a composition including the proteasome; under conditions that support processing of the substrate by proteasome; and assaying for liberation of epitope. The invention may be useful for the development of compounds with a cytostatic, antibacterial, proteasome; proteosoacide or fungicide activity acting as T-cell activators. In addition, the invention may allow development of a vaccine. The invention is useful for identifying a polypeptide suitable for epitope liberation, where the epitope is a housekeeping epitope. The compositions comprising the identified housekeeping epitopes are useful in vitro in vaccine development or in the generation or expansion of cytotoxic T lymphocyte (CTL) to be used in adoptive immunotherapy. The invention is also useful
                                                                                                                                                                 ö

ö
for activating T-cells against neoplastic cells, and cells infected with virus, bacterium, protozoan or fungus. CTL epitopes are identified based on the knowledge that such epitopes are, in fact, produced by the housekeeping proteasome system. Once identified, these epitopes, embodied as peptides, can be used to successfully immunise or induce therapeutic CTL responses against housekeeping proteasome expressing target cells in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a cancer associated antigen. The clone from which the DNA sequence is obtained is designated NY-ESO-1. The specification described a method for determining regression, progression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     isolated cancer associated antigen - is used to develop products for diagnosis and treatment of cancers and for monitoring cancer therapy

describes LAGE-1 tumour associated protein (TAP). The present invention which is used in an example from the present invention which describes LAGE-1 tumour associated protein (TAP). The present invention also describes LAGE-1 tumour associated protein (TAP). The present invention characterised by expression of a LAGE-1 nucleic acid molecule or an expression product, comprising administering to the subject autologous cytolytic T cells to ameliorate the disorder, where the cytolytic T cells care specific for complexes of an HLA molecule and a LAGE-1 TAP or an characterised by expression of a LAGE-1 nucleic acid molecule or an expression product, comprising administering a LAGE-1 TAP or an expression product, comprising administering a LAGE-1 TAP or an expression product, comprising administering a LAGE-1 TAP or an expression product, comprising administering a LAGE-1 TAP or an especific for a LAGE-1 TAP comprising contacting an isolated population of T cells with an agent presenting a complex of a LAGE TAP or an immunogenic fragment and a HLA presenting molecule to selectively enrich the isolated population of T cells with the cytolytic T cells the isolated population of T cells with the cytolytic T cells. The methods and products from the present invention can be used for the
                                                                                                                                                                                                                                                                            ö
of onset of a cancerous condition, comprising monitoring a sample from a parameter selected from NY-BSO partient with the cancerous condition for a parameter selected from NY-BSO 1 protein, a peptide derived from NY-BSO-1 protein and cytolytic T cells specific for the peptide and an NHC molecule with which it non-covalently complexes. Methods for the treatment of a cancerous condition are also described. The NY-BSO-1 protein and peptides derived from it can be used for diagnosis and treatment of cancers and to monitor the efficacy of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents human NY-ESO-1, formerly known as LL-1.2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated LAGE-1 tumour associated nucleic acids - used to develop products for the diagnosis and treatment of LAGE-1 associated disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide
                                                                                                                                                                            AAY5243
                                                                                                             용
                                                                                  ò
                                                                                                                                                                                                           The present sequence represents the ORF1 protein encoded by open reading frame 1 of the human ESO-1/CAG-3 (or CAG-3) gene. CAG-3 is a new and content antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides comprising ORF1, ORF2 (see AAY05966), portions of these peptides comprising ORF1, ORF2 (see CAY05966), portions of these peptides and their variants (see AAY05965).

AAY05966), portions of these peptides and their variants (see AAY05965).

CAAY05966), portions of these peptides and their variants (see AAY05965).

CAAY05966), portions of these peptides concer the receiptent from development of cancer. The invention provides: vectors and host cells car transgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide, useful in diagnostic and detection assays; and methods of the cancer peptide, useful in diagnostic and detection assays; and methods of the verthout an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, concerved from, cancers such as primary or metastatic melanoma, thymoma, carvical cancer, bladder cancer, liver cancer, leukaemia, uterine cancer, lymphoma, astroma, lung cancer, liver cancer, leukaemia, uterine cancer, lymphoma, astroma, lung cancer, liver cancer, leukaemia, uterine cancer, lymphoma, astroma, pancreatic, and thyroid cancers. Melanoma is cancer and adenocarcinomas such cancer and adenocarcinoma is cancer and adenocarcinomas such cancer and adenocarcinomas such cancer and adenocarcinomas such cancer and adenocarcinomas such cancer and aden

concoding which was isolated from an oesophagus squamous cell cancer cDNA library. Tissue localisation studies revealed it to be expressed at high levels in normal ovary and testis but not in normal colon, kidney, liver, brain, oesophagus and skin. It was expressed in certain tumours and tumour cell lines with some degree of frequency - these included melanoma especiamens and cell lines, and breast and blader cancer specimens, with expression in other tumour types being sporadic. Peptides derived from NY ESO-1 are bound by both MHC (major histocompatibility complex) class I molecules for presentation to T-cells. Peptides AAY52431-Y52434 bind to Class I HLA-2 molecules, thereby stimulating proliferation of cycotoxic T-cells, while peptides AAY5245-Y52440 bind collss I HLA-DRS3 molecules, stimulating helper T-cell proliferation. The peptides derived from NY-ESO-1 may be used in methods and compositions used for the treatment, diagnosis and prevention of cancers (such as melanoma, bersat cancer, prostate cancer, lung cancer, hepatoma, ovarian cancer, thyroid cancer, prolls This sequence represents a human tumour antigen, NY-ESO-1, the cDNA

RESULT 11

ö The present sequence is the human NY-ESO-1 protein, a tumour antigen, identified by screening an esophagus carcinoma cDNA library. This protein tumour deading frame (ORF)-1 that contain epitopes of tumour specific T-cells. NY-ESO-1 is expressed in different tumour types, but not in healthy tissues except in testis. It also shows homology with the CAMEL (Cytotoxic T lymphocytes (CTL)-recognised Antigen on MELanoma) protein, a tumour-asociated antigen. The tumour-associated antigen and displayed on melanoma cells is recognised by cytotoxic T lymphocytes. This sequence has anticancer activity. CAMEL tumour antigen and immunogenic peptides derived from it are useful for cancer immunotherapy. They have the potential to induce an immune response, by eliciting a CTL response. The DNA molecule is used for the construction of recombinant or NY-ESO-1; CAMEL; CTL-recognised Antigen on MELanoma; human; cancer; CTL; cytotoxic T lymphocyte; tumour-associated antigen; LAGE-1; anticancer; melanoma; immunotherapy; immune response. Tumor-associated antigen useful for cancer immunotherapy is encoded by the open reading frame of LAGE-1 (a tumor-specific antigen) cDNA. Gaps ò 100.0%; Score 74; DB 3; Length 180; 100.0%; Pred. This sequence represents a human oesophageal cancer-associated antigen, NY-ESO-1. The CDNA encoding this sequence was isolated from a cDNA encoding this sequence was isolated from a cDNA can a specimen of well-to-moderately differentiated squamous cell cancer of the oesophagus. Expression analysis demonstrated that NY-ESO-1 was expressed in oesophagus Expression analysis demonstrated that NY-ESO-1 was expressed in oesophagus listue, but not in normal colon, kidney, liver or brain tissue. Analysis of the amino acid sequence of the protein indicates that the protein has a transmembrane domain, several N-myriscoylation sites and O-phosphorylation sites and that it antigen is useful as an immunogen when combined with an adjuvant, in both proteurs and post- translationally modified forms, and may be used to generate anti-NY-ESO-1 antibodies. It can also be used as a diagnostic marker for oesophageal cancer, and can be utilised as a marker for the targetted delivery of therapeutic agents to oesophageal cancer cells. It can also be used to generate diagnostic or therapeutic agents

It is provided in a specification relating to a method for determining the status of a cancerous condition in a patient with a tumour that expresses NY-ESO-1. The method comprises assaying a sample taken from the patient for antibodies that specifically bind to the NY-ESO-1 and comparing the value obtained from assay of a prior sample taken from the patient. Any difference between the values is indicative of a change in status of the cancerous condition. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                  Method useful for determining the status (e.g. progression, regression or stability of the disease) of a cancerous condition, involves determining the levels of NY-ESO-1 specific antibodies in a sample taken from a

                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents cancer testis tumour antigen NY-ESO-1 dalso called LAGE-2). NY-ESO-1 is a molecule that is processed to at least one human leukcoyte antigen (HLA) binding peptide, which binds to class I and Class II major histocompatibility complex (MHC). NY-ESO-1 is expressed in tumour mRNA and in testis, but not normal colon, kidney, liver or brain tissue. The presence or level of expression of NY-ESO-1 may be assayed for the diagnosis of cancer, especially testis tumours
                                                                                                         Cancer testis tumour antigen; NY-ESO-1; LAGE-2; human leukocyte antigen; HLA; HLA binding peptide; major histocompatibility complex; MHC; tumour;

The sequence represents a human NY-ESO-1 tumour rejection antigen or precursor. NY-ESO-1 and SSX-2 polypeptides, or fragments of, bind to precursor. NY-ESO-1 and SSX-2 polypeptides, or fragments of, bind to major histocompatibility complex (MHC) Class II molecules such as human leukoryte antigen-determining region (HLA-DR) molecules and stimulate proliferation of helper T cells. The peptides can be administered to an HLA-DR positive subject in order to stimulate the helper T cells. An MHC class II HLA-DR.NY-ESO-1/SSX-2 complex expressed on the surface of a cell cor present in free form is useful for this stimulation. The nucleic acid is useful for screening for a cancerous condition, which involves contacting a subject sample to a cell line transfected with the concer. In addition, a sample from a patient (for example, a body fluid or tissue) can be monitored for the amount of the complex present in the CD loodstream. This is useful for determining regression, progression or onset of a cancerous condition. The method involves contacting the sample with a radioactive labelled or enzyme labelled monoclonal antibody which specifically binds with the complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptides binding to major histocompatibility complex class II human leukocyte antigen-determining region molecule having amino acid sequence found in tumor rejection antigen precursor used for stimulating proliferation of helper I cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The MHC-II epitopes (TC from NY SEO-I are recognised by CD4+ T lymphocytes in an human leucocyte antigen (HLA) class II restricted manner, in particular HLA-DR or HLA-DP crestricted. The products of the gene are promising candidates for immunotherapeutic strategies for the prevention, treatment and diagnosis of patients with cancer. The cancer epitopes are useful as immunogen and vaccine to inhibit or to prevent cancer in a mammal by eliciting CD4+ T lymphocytes resulting in protection of the recipient from development of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection from metastasis, or by inhibiting the growth of cancer and protection agent to detect the presence of cancer, to enhance the generation of antibody and/or CD8+ T cell responses against any given target antigen and/or hapten and to induce tumour-specific humoral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New NY-ESO cancer peptide or MHC class II restricted T cell epitopes, useful as immunogen and vaccine for inhibiting cancer in a mammal or as protection from metastasis.
                                                                                                 Human, major histocompatibility complex; MHC; vaccine; metastasis; class II restricted T cell epitope; MHC-II epitope; cancer antigen; NY ESO-1 protein; CD4+ T lymphocyte; human leucocyte antigen; HLA; tumour-specific humoral-mediated immunity; cancer; cytostatic;

SEQUENCE CHARACTERISTICS:
LENGTH: 180 amino acids
TYPE: amino acid
TOPOLOGY: linear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      49 GAARASGPGGGAPR 62
